TITLE: Optical recording medium with pressed graphite storage film - with metallic lustre, for laser recording with higher contrast than with carbon binder film

Basic Abstract Text (2):

Pref. the substrate consists of polymethyl methacrylate (PMMA) or polycarbonate.

The medium is produced by stamping a graphite film to a dia. of 10-30 cm, pressing at 300-8000 bar and opt. pressing again with the substrate layer(s), which pref. is first provided with grooves.

ABSTRACT:

An improved method enables preparation of articles for a variety of applications, including embossing or otherwise shaping to form a variety of articles. A plurality of thin, preferably resin-impregnated, flexible graphite sheets are arranged to form zones in a composite material having a graded density or other characteristic. Variation of properties between zones in the stock material formed is useful for achieving a desired set of properties in the formation of articles such as those useful in electrochemical fuel cells and double-layer capacitors.

L2: Entry 9 of 17

File: PGPB

Dec 5, 2002

DOCUMENT-IDENTIFIER: US 20020182387 A1

TITLE: Method for preparing composite flexible graphite material

INVENTOR:Getz, Matthew George

CLAIMS:

1. A material useful as a substrate for an embossed flexible graphite sheet, the material comprising a composite flexible graphite sheet comprising a plurality of zones of flexible graphite sheet, wherein: at least one of said plurality of zones has a characteristic different from at least one other of said plurality of zones.
2. A material according to claim 1 wherein at least one of said zones comprises resin-impregnated graphite sheet.
3. The material of claim 1 wherein the property is one selected from the group consisting of: electrical conductivity, thermal conductivity, density, void condition, area weight, gas permeability, water permeability, particle size, type of graphite starting material, presence and composition of filler materials, degree of graphite intumescence, latent intumescence potential, the presence and composition of intercalation compounds, the presence and composition of residues, resin content and composition, degree of resin drying, degree of resin cure or cross-link, and the like.
7. The material of claim 1 comprising as at least one of said zones, a graphite sheet material 2 of area weight of from about 0.001 to about 2.0 g/cm.sup.2.
12. The material of claim 1 wherein the resin is present at a level of at least about 5% in the flexible graphite sheet.
14. A process for preparing a composite material useful as a substrate for forming an embossed flexible graphite sheet, comprising a plurality of zones of flexible graphite sheet, wherein at least one of said plurality of zones has a density higher than at least one other of said plurality of regions, comprising; placing a first portion of resin-impregnated flexible graphite sheet in contact with at least one other portion of resin-impregnated flexible graphite sheet having a characteristic different from said first portion to form a composite; and subjecting the composite to consolidating pressure.
15. A process according to claim 14 wherein at least one of said zones comprises resin-impregnated graphite sheet.
16. A process according to claim 14 wherein the property is one selected from the group consisting of: electrical conductivity, thermal conductivity, density, void condition, area weight, gas permeability, water permeability, particle size, type of graphite starting material, presence and composition of filler materials, degree of graphite intumescence, latent intumescence potential, the presence and composition of intercalation compounds, the presence and composition of residues, resin content and composition, degree of resin drying, degree of resin cure or cross-link, and the like.
20. A process according to claim 14 wherein at least one of said zones, comprises a

graphite sheet material of area weight of from about 0.001 to about 2.0 g/cm.^{sup.2}.

26. A process according to claim 14 wherein the resin is present at a level of at least about 5% in the flexible graphite sheet.
